

# Anode Installation

ENGIE Fabricom has successfully completed many projects to install internal sacrificial anodes.

These consisted of working with our clients to develop the installation method below the drivers' hatch to enable the anodes to be placed within the internal water.

Typically, campaigns consist of:

- Transfer to field
- The set up of a rolling total of foundation equipment, components and safety access and egress
- Installation of a new ventilation system under the drivers' hatch within the confined space
- Painting and paint inspection to NORSOK M501 standards
- Installation of internal anodes in accordance with the developed installation procedures
- Inspection of the final installed ventilation system and anodes and sign off

- De-mobilisation of all the equipment from the foundation back to the onshore base

Our aim is to be our clients'  
Partner of Choice
