

# Cathodic Protection Repair Installation and Inspection

ENGIE Fabricom has an established team to carry out both internal and external cathodic protection, providing analysis of anodes to determine their suitability and level of protection provided to the monopole.

Fabricom carries out offshore cathodic protection measurements, which are analysed and a detailed report issued on the anode's performance.

This is based on the offshore requirements recommended by the DNV specification for cathodic protection.

Cathodic protection checks include:

- External cathodic protection measurements
- Foundation set up for safe access into the confined space, including rescue equipment and fully trained technicians
- Internal cathodic protection measurements for foundations with anodes below the divers' hatch
- Dissolved oxygen and pH measurements below the divers' hatch

- Provide documentation to support the measurements completed offshore

Our aim is to be our clients'  
Partner of Choice
