# Safety Modifications

---

ENGIE Fabricom has developed new and innovative system designs for access and egress within the wind turbine. These designs are installed by our experience technicians and provide safe and quick access to the lower platforms utilising a safety gate barrier over the previous hatch in the floor.

The safety gate system can also be quickly folded back to the TP wall, blocking access to the hatch preventing accidents occurring and is a typical example of a wide range of safety modifications designed, fabricated and installed by ENGIE Fabricom for offshore wind turbines from the entry level up to the nacelle.
