

# Substation Commissioning

ENGIE Fabricom in the UK has strong links within the wider ENGIE Group to form strong partnerships within Europe.

One such partnership is with ENGIE Fabricom Belgium, where specialist teams are engaged to work with UK employees to complete electrical and mechanical works on onshore and offshore facilities. The specialist skills held by these teams ensure a seamless transition from onshore works through to the final offshore installation of a project.

Work is carried out throughout the UK for various clients, and predominantly involves a full range of works on electrical systems, from design, fabrication and installation through to commissioning and final handover.

Project teams are mobilised to one of ENGIE Fabricom's locations in the UK or Europe to ensure full familiarisation and understanding before offshore works commence.

Project specific stages may include:

- Substation design and fabrication
- Management of all commissioning, electrical and mechanical resources
- Provision of training, onshore support, logistics, PPE and tooling
- Carrying out punch list items both onshore through to offshore phase
- Recording all punch list and commissioning works for hand over and traceability
- Procurement of materials
- Completion of commissioning works and sign off
- Carrying out testing on LV systems with sign off
- Final preparation and handover of substation to the client

Our aim is to be our clients'  
Partner of Choice
