

Statutory and Turbine Inspections

ENGIE Fabricom can provide statutory and turbine inspections in accordance with the written scheme of requirements for the life span of the wind turbine.

We can also carry out external and internal platform and ladder inspections incorporating coating inspections from the Nacelle down to the internal water level below the airtight deck.

These inspections are carried out by our in-house inspectors based on the specific requirements of the foundation. The results are compiled and issued back to the onshore office support to finalise the final detailed report.

We can also carry out engineering inspections including both pre and post installation of elastomeric bearings during the remedial repair of grout slippage.

Internal and external inspections include:

- All ladders, monopile, platforms, hook on points and bolts
- Paint inspection to NORSOK M501
- Lighting systems

- Earthing and lightning protection
- Set up rescue system for lower confined space entry
- ROV inspections
- Internal J-tube (hang off flange on airtight deck)
- Internal J-tube wires in confined space (under diver's hatch)
- Internal water pH results and water level movement
- External cathodic protection (CP) measurements
- Compile all results and produce detailed reports

Our aim is to be our clients' Partner of Choice
